

1. Read back over your sampling plan. Are you confident that it resulted in a sample that is representative of all theses in the tower? What are its strengths / weaknesses?

2. Consider the data that you collected. What sorts of **visualizations** could you create to learn about the phenomenon of senior thesis checkouts? Please sketch those plots below.

3. What sort of **inferential questions** could you ask of this data? Please list them below, noting the hypotheses of interest (if using the hypothesis testing framework), the parameters of interest (if using the confidence interval framework), and which sampling distributions you'd use (either via approximation or simulation).
